

Docker Cheat Sheet

Running Containers

<code>docker run -it ubuntu bash</code>	Run container and specify command
<code>docker run -it ubuntu</code>	Run container
<code>docker run -tid ubuntu</code>	Run container detached
<code>docker create -it ubuntu</code>	Create a container without starting it
<code>docker run -tid --name smelly-hippo ubuntu</code>	named container
<code>docker ps</code>	show running containers
<code>docker ps -a</code>	show all containers
<code>docker ps --filter name=web1</code>	show matching containers
<code>docker ps --filter name=web1 -q</code>	show matching container ID
<code>docker inspect smelly-hippo</code>	inspect container

Container Lifecycle Stuff

<code>docker start smelly-hippo</code>	start
<code>docker stop smelly-hippo</code>	stop
<code>docker stop smelly-hippo funny-frog</code>	stop mutiple
<code>docker restart smelly-hippo</code>	restart container
<code>docker pause smelly-hippo</code>	pauses a running container, freeze in place
<code>docker unpause smelly-hippo</code>	unpause a container
<code>docker wait smelly-hippo</code>	blocks until running container stops
<code>docker kill smelly-hippo</code>	sends SIGKILL, faster than stop
<code>docker rm smelly-hippo</code>	remove
<code>docker rm smelly-hippo funny-frog</code>	remove multiple
<code>docker rm -f smelly-hippo</code>	force remove
<code>docker container rm -f \$(docker ps -aq)</code>	Remove all containers, running or stopped

Resource Limits and Controls

<code>docker run -tid -c 512 ubuntu</code>	50% cpu
<code>docker run -tid --cpuset-cpus=0,4,6 ubuntu</code>	use these cpus
<code>docker run -tid -m 300M ubuntu</code>	limit memory
<code>docker create -li --storage-opt size=120G ubuntu</code>	limit storage, not on aufs

Stats, Logs, and Events

<code>docker stats</code>	resource stats for all containers
<code>docker stats smelly-hippo</code>	resource stats for one container
<code>docker top smelly-hippo</code>	shows processes in a container
<code>docker logs web</code>	container logs
<code>docker events</code>	watch events in real time
<code>docker port nostalgic_colden</code>	shows public facing port of container
<code>docker diff practical_sinoussi</code>	show changes to a container's file system

Docker Images

<code>docker images</code>	show images
<code>docker history ubuntu</code>	show history of image
<code>docker image rm user1/funny-frog</code>	remove image
<code>docker image remove 113a43faa138</code>	remove by id
<code>docker image remove user1/funny-frog</code>	remove image
<code>docker rmi user1/funny-frog</code>	remove image
<code>docker rmi \$(docker images -q)</code>	remove all images
Commit container to an image:	
<code>docker commit smelly-hippo</code>	no repo name
<code>docker commit smelly-hippo test1</code>	repo name
<code>docker commit smelly-hippo loworbitflux/test1</code>	repo name
<code>docker commit smelly-hippo loworbitflux/test1:my-update</code>	tagged
<code>docker commit smelly-hippo loworbitflux/test1:v1.2.3</code>	tagged

Export / Import / Save / Load

<code>docker export</code>	export container to tarball archive stream
<code>docker import</code>	create image from tarball, excludes history (smaller image)
<code>docker load</code>	load an image from tarball, includes history (larger image)
<code>docker save</code>	save image to tar archive stream (includes parent layers)
Examples:	
<code>docker load < my-image.tar.gz</code>	
<code>docker save my_image:my_tag gzip > my-image.tar.gz</code>	
<code>cat my-container.tar.gz docker import - my-image:my_tag</code>	
<code>docker export my-container gzip > my-container.tar.gz</code>	

Docker Hub / Registry

<code>docker login</code>	Login to Registry
<code>docker logout</code>	Logout of Registry
<code>docker tag 7d9495d03763 loworbitflux/smelly-hippo:latest</code>	Tag an image
<code>docker push loworbitflux/smelly-hippo</code>	Push to registry
<code>docker search mysql</code>	Search for an image
<code>docker pull mysql</code>	Pull it down
<code>docker run user1/funny-frog</code>	Will be downloaded if it isn't here

Building Docker Images From A Dockerfile

<code>mkdir mydockerbuild</code>	Create build dir
<code>cd mydockerbuild</code>	cd into build dir
<code>vi Dockerfile</code>	Edit build instructions
<code>docker build -t mydockerimage</code>	Build the image (note the dot ".")
<code>docker images</code>	Show images
<code>docker run mydockerimage</code>	Run the new image

Simple Dockerfile Example

<code>FROM ubuntu</code>
<code>RUN apt update</code>
<code>RUN apt install nginx -y</code>
<code>CMD ["usr/sbin/nginx"]</code>

Big Dockerfile Example

<code>FROM ubuntu</code>	base image
<code>RUN apt update</code>	run commands while building
<code>RUN apt install nginx -y</code>	run commands while building
<code>WORKDIR -/</code>	working dir that CMD is run from
<code>ENTRYPOINT echo</code>	default application
<code>CMD "echo" "Hello docker!"</code>	main command / default application
<code>CMD ["-port 27017"]</code>	params for ENTRYPOINT
<code>CMD "Hello docker!"</code>	params for ENTRYPOINT
<code>ENV SERVER_WORKS 4</code>	set env variable
<code>EXPOSE 8080</code>	expose a port, not published to the host
<code>MAINTAINER authors_name</code>	deprecated
<code>LABEL version="1.0"</code>	add metadata
<code>LABEL author="User One"</code>	add metadata
<code>USER 751</code>	UID (or username) to run as
<code>VOLUME ["my_files"]</code>	sets up a volume
<code>COPY test relativeDir/</code>	copies "test" to `WORKDIR`/relativeDir/
<code>COPY test /absoluteDir/</code>	copies "test" to /absoluteDir/
<code>COPY ssh_config /etc/ssh/ssh_config</code>	copy over a vile
<code>COPY --chown=user1:group1 files* /data/</code>	also changes ownership
<code>ADD /dir1 /dir2</code>	like copy but does more...

Volumes / Storage

<code>docker info grep -i storage</code>	check storage driver
<code>docker inspect web</code>	look for "Mounts"
<code>docker volume ls</code>	show voluems
<code>docker volume create testvol1</code>	create a volume
<code>docker volume inspect testvol1</code>	inspect a volume
<code>docker volume ls -f dangling=true</code>	find dangling (unused) volumes
<code>docker volume rm volume1</code>	remove volume
Running containers with volumes:	
<code>docker run -d --name test1 -v /data ubuntu</code>	unnamed volume mounted on /data
<code>docker run -d --name test2 -v vol1:/data ubuntu</code>	named volume
<code>docker run -d --name test3 -v /src/data:/data ubuntu</code>	bind mount
<code>docker run -d --name test4 -v /src/data:/data:ro ubuntu</code>	RO
<code>docker run -d --volumes-from test2 --name test5 ubuntu</code>	storage can be shared
<code>docker rm -v test1</code>	remove container and unnamed volume
Access and sharing parameters:	
<code>:ro</code>	for read only
<code>:z</code>	shared all containers can read/write
<code>:Z</code>	private, unshared
<code>-</code>	
<code>/var/lib/docker/overlay2</code>	Default volume storage location on Ubuntu Linux

Expose Ports

<code>docker run -tid -p 1234:80 nginx</code>	expose container port 80 on host port 1234
<code>docker run -tid -p 80:5000 ubuntu</code>	bind port
<code>docker run -tid -p 8000-9000:5000 ubuntu</code>	bind port to range
<code>docker run -tid -p 80:5000/udp ubuntu</code>	udp ports
<code>docker run -tid -p 127.0.0.1:80:5000 ubuntu</code>	bind port on an interface
<code>docker run -tid -p 127.0.0.1::5000 ubuntu</code>	bind any port, specific interface
<code>docker run -tid -P ubuntu</code>	exposed ports to random ports

Networks

<code>docker network ls</code>	show networks, bridge is default
<code>docker network inspect bridge</code>	show network details and connected containers
Create Bridge Network. Specify Subnet and Gateway:	
<code>docker network create -d bridge my-network</code>	
<code>docker network create -d bridge --subnet 172.25.0.0/16 my-network</code>	
<code>docker network create --subnet 203.0.113.0/24 --gateway 203.0.113.254 my-network</code>	
<code>docker network rm my-network</code>	remove network
Run container and specify network:	
<code>docker run -tid --net=my-network --name test1 ubuntu</code>	
Run container, specify network and IP:	
<code>docker run -tid --net=my-network --ip=172.25.3.3 --name=test1 ubuntu</code>	
Connect container to network:	
<code>docker network connect net1 test1</code>	
<code>docker network connect net1 test2 --ip 172.25.0.102</code>	
Disconnect container from network:	
<code>docker network disconnect net1 test1</code>	Disconnect container from this network
<code>docker network disconnect -f test1 test2</code>	Force disconnect
Find container's IP address:	
<code>docker inspect -f '{{json .NetworkSettings.Networks}}' container1</code>	
<code>docker inspect -f '{{range .NetworkSettings.Networks}}{{.IPAddress}}{{end}}' container1</code>
